Bhopal, Madhya Pradesh

Summary

Final-year Computer Science student at VIT Bhopal with hands-on experience developing full-stack web applications using React, Node.js, TypeScript, and Python. Skilled in REST API design, SQL and NoSQL databases, and machine learning model development using Scikit-learn. Also experienced in low-level C++ systems programming, having built a custom ML library from scratch. Self-driven and comfortable delivering end-to-end solutions independently.

Skills

- **Languages:** JavaScript, TypeScript, C++, Python, SQL
- **Frontend:** React.js, Next.js, Tailwind CSS, Socket.io, HTML, CSS
- **Backend:** Node.js, Express.js, Flask, REST API, Zod, WebSockets
- **Databases:** PostgreSQL, MongoDB
- **Machine Learning:** Scikit-learn, PyTorch, Pandas, NumPy
- **Tools:** Git, GitHub, Vercel, Linux

Education

- B.Tech, Computer Science and Engineering, VIT Bhopal University CGPA: 8.58 | Expected May 2027

Projects

Smart Tutor - Adaptive Learning System adaptive-learning-application.vercel.app | GitHub

- Developed an adaptive tutoring system that adjusts question difficulty in real time based on individual student performance.
- Trained a performance classifier using Scikit-learn and deployed it via Flask as a REST API for real-time difficulty predictions.
- Engineered a separate backend service with TypeScript, Express, and Zod to handle authentication, question recommendation, and request validation.
- Modelled student profiles, performance records, and question banks in MongoDB to power the recommendation engine.

Custom C++ Machine Learning Library ml-from-scratch-cpp.vercel.app | GitHub

- Implemented a lightweight, dependency-free machine learning library in C++ covering Linear Regression, Logistic Regression, K-Means Clustering, and Naive Bayes with a modular class-based architecture.
- Exposed model training and inference endpoints via a TypeScript API, interfacing directly with the custom C++ models.
- Authored a Python benchmark script to compare performance against Scikit-learn and visualized results on a React frontend deployed on Vercel.

songRoom - Real-Time Music Streaming and Chat github.com/AmlanJSarmah/songRoom

- Built a real-time collaborative application allowing multiple users to stream songs and chat simultaneously in shared rooms.
- Engineered a responsive, component-driven React.js frontend with live state updates for a seamless listening experience.
- Architected the backend with Node.js, Express, and Socket.io to power WebSocket communication for synchronized playback and low-latency chat.
- Stored user data, room metadata, and song history in MongoDB, leveraging its flexible document model for rapid iteration.

Work Experience

Technical Team Lead, North East Club, VIT Bhopal *August 2024 to August 2025*

- Led a team of 11 developers, driving all technical decisions for a club of 100 plus members.
- Designed and deployed the club's official responsive website using React.js and Tailwind CSS, improving information accessibility for 100 plus members.
- Coordinated technical logistics and on-site support for 3 club events, each attended by 150 to 200 participants.
